

Customer support that combines clarity, calm troubleshooting, and operational ownership.

I bring four years of remote, customer-facing hospitality operations, a technical foundation from engineering and computer science studies, and psychology training that helps me communicate with people under uncertainty. This portfolio documents real experience, three completed WooCommerce troubleshooting exercises, self-directed technical projects, and clearly labelled support simulations.

Relevant experience

The evidence below separates professional work from portfolio labs. I do not present simulations as customer work or claim technical experience I have not completed.

REAL EXPERIENCE

Remote hospitality operations and customer support

For four years, I managed guest communication and operational coordination for short-term accommodation remotely.

- Wrote pre-arrival, access, Wi-Fi, electricity, key-box, checkout, and issue-resolution instructions.
- Supported guests with different technical confidence levels and different preferences for contact.
- Coordinated cleaners, maintenance, access, and handoffs without being physically present.
- Handled time-sensitive problems while keeping communication calm, specific, and practical.

Transferable support strength:

diagnosing incomplete descriptions, asking for the right evidence, setting expectations, and owning the next step.

REAL EXPERIENCE

Technical and analytical foundation

My route into support is interdisciplinary rather than conventional.

- Prior studies in Electrical Engineering and Computer Science, including Python and C/C++.
- Current BSc Psychology studies, strengthening interviewing, communication, research, and behavioural understanding.
- Hands-on work with R, SPSS, Excel, data cleaning, regression analysis, and reproducible documentation.
- Personal experience building and maintaining sites in Squarespace, including content structure and site configuration.

Transferable technical strength:

learning unfamiliar systems methodically and explaining them without unnecessary jargon.

Each item is documented with its context, process, limitations, and the evidence it provides for customer support and distributed work.

Selected work

REAL EXPERIENCE

Remote Guest Operations

A case study on writing low-friction instructions, coordinating handoffs, and resolving practical problems remotely.

Read case study →

SELF-DIRECTED PROJECT

Reproducible R Analysis

An independent analysis that cleaned 254 records to an analysis sample of 247 and documented three regression models.

Read case study →

SELF-DIRECTED PROJECT

Research Outreach System

A structured tracker for 30+ research contacts, six targeted CV variants, statuses, follow-ups, and duplicate prevention.

AI WORKFLOW PROTOTYPE

Support Triage & QA

A Python workflow for ticket classification, missing-information checks, risk flags, troubleshooting actions, and draft reply review.

View project documentation →

Hands-on WooCommerce troubleshooting

These are completed technical exercises, not hypothetical tickets. Each incident was reproduced in a disposable store, corrected through a controlled change, and verified from both the customer interface and the admin.

01	SHIPPING ZONES	Missing German flat rate Restored €5 shipping for a valid Berlin checkout. View evidence →
02	VARIATION INVENTORY	A5 shown out of stock Isolated the issue to one variation and restored its stock to 15. View evidence →
03	PAYMENTS & ORDERS	No payment method Completed and verified order #21 through Direct Bank Transfer. View evidence →

Eight synthetic WooCommerce cases complement the three completed hands-on exercises and demonstrate how I structure an investigation and communicate before I know the final cause. The goal is not to guess quickly; it is to reduce risk and reach a verifiable answer.

Support laboratory

WC-101	Customer charged, order still Pending payment Payments & orders · simulated support case	High
WC-102	Order emails are not reaching customers Email delivery · simulated support case	Medium
WC-103	German flat-rate shipping is missing at checkout Shipping · simulated support case	Medium
WC-104	Checkout broke after a plugin update Plugin conflict · simulated support case	Critical
WC-105	Connection is not private after domain change	High

A consistent process helps me stay useful when a customer is frustrated, information is incomplete, or a change could affect revenue or data.

My troubleshooting method

1

Clarify impact

Who is affected, what changed, and how urgent is the business consequence?

2

Collect evidence

Exact error, timestamps, order IDs, logs, screenshots, environment, and recent changes.

3

Reduce scope

Reproduce safely, compare working and failing states, and change one variable at a time.

4

Communicate next step

Explain what I know, what I do not know, and what will happen next.

5

Document and prevent

Record the cause, resolution, limitations, and any product or process improvement.

This prototype uses AI as a constrained analysis layer rather than an automatic answer machine. It supports prioritization and drafting while preserving human review for financial, privacy, and outage-related cases.

AI-assisted support workflow

WORKING PROTOTYPE

What the workflow does

- Reads support tickets from CSV.
- Redacts obvious email addresses and phone numbers before optional API use.
- Returns structured category, priority, sentiment, risk flags, missing information, recommended actions, and a draft response.
- Works in deterministic local mode without an API key.
- Optionally uses the OpenAI Responses API with schema-constrained output.
- Exports machine-readable JSON and a human-review HTML report.

[Review sample output](#)

LEARNING EVIDENCE

What I learned

- A fluent draft can still contain an unsafe assumption.
- Structured output improves consistency but does not remove the need for verification.
- Financial and outage cases require explicit human-review rules.
- Prompts work better when they define what the system must not claim or promise.
- A local fallback makes the workflow auditable and usable when an AI service is unavailable.

[Architecture and limitations](#) →

I am strongest where customer communication, process discipline, technical learning, and written documentation overlap.

Greek · English · German B2

Clear communication is part of the technical solution.

I am interested in support as a long-term craft: understanding the customer's goal, solving the immediate problem, documenting what happened, and improving the system that produced it.
